RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 54 pages. Dimensions: 9.5in. x 7.3in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1868 Excerpt: . . . axis of all the sections. The sections do not quite reach the axis of the eye, but a cylindrical space is left centrally, without membranous structure, and which is considerably larger in the child than in the adult. The walls of the sections gradually become more delicate, until they can no longer be discerned. Hanover counted 180 radii in the human eye, and he believes that to be the sum of the sections composing the vitreous body. Finkbeiner claims that the section walls are the same in structure as the mcmbrana hyaloidea, having on each side a layer of pavement-cells. This division into sections, as taught by Hanover, and later, by Finkbeiner, is sustained by Pilz, Bowman, Heiberg, and others. Pilz says this cannot be an error, such as Briicke was led into, when he thought the vitreous body laminated, resulting, Pilz thinks, from the effect of the solution of the acetate of lead, which he used as a hardening remedy. The hyaloid membrane must be divided into the portion that envelops the vitreous body, and that portion extending from the beginning of the ora serrata to the capsule of the lens. Whilst this membrane, in the back part of the eye, envelops the corpus vitreum as a single membrane, it divides itself, in the region of the ora serrata retina, into two plates, of which the posterior one forms the anterior wall of the vitreous body, its anterior surface forming a dish-shaped concavity (fossa hyaloidea)...
